

## The bricks and mortar of educational excellence

Today, it takes more than dedicated teachers and an outstanding curriculum to achieve a positive learning experience. The actual building can be an active partner in a successful education. Studies have found that students' learning is affected by everything from outdated classroom technology to poor air quality, inconsistent temperature and inferior lighting. Educational facilities and technology are important tools in creating a superior academic environment.

By integrating building, IT and communications, school and administration, and classroom learning systems, Johnson Controls is able to reduce costs, enhance technology, and improve energy and operational efficiency of the school environment. And because these systems can be managed on a unified, intelligent infrastructure, teachers, students and staff will have the information they need to facilitate learning, no matter where they are. The result is a healthy, safe, comfortable, and technologically advanced school aimed at enhancing student performance.

## Before you build, do your homework

Johnson Controls building wide systems integration brings technology into the classroom to positively impact how we are preparing today's students for tomorrow's challenges. By initiating a technology integration conversation with us at the beginning of the planning phase of your project, we can help you design and implement the optimum technology solution for all of your building communications and business systems. Through Technology Contracting™ we can assist with the design, help accelerate schedules, eliminate redundant systems and cabling, and manage the on-time delivery and integration of the various systems. This coordinated approach also lays the groundwork for future systems integration with other schools in the district. Best of all, we'll deliver these technology solutions to your district with minimal disruptions to your annual budget, while maximizing future returns on your investment. Since public contracts often focus on lowest cost, there tends to be a scope gap between what you want, and what the contractor can provide. But we can help you have a bigger impact on first and lifecycle costs – and afford the things you want for your school.

## Smart buildings: The prevailing school of thought

Our goal is to help create places where teachers inspire, students achieve and feel safe, and districts prosper. And those places are inside of our buildings. Since 2003, we've provided proven solutions to educational facilities across North America to bring the benefits of building wide systems integration to their buildings, staff and students. Nobody has more design/assist experience and expertise, allowing us to deliver converged technology solutions that produce smarter schools and enhanced student achievement.

## Make your building an honor student

Let our building wide systems integration experts help you achieve the smart, safe, technology-rich learning environment you want for your students. We'll show you how to utilize technology to drive your mission, improve operations, and reduce both first and operating costs. And make sure the smartest thing in your school is your school.
