

OpenBlue Clean Air

The 5 Pillars of Your Clean Air Strategy

OpenBlue Clean Air from Johnson Controls helps you deliver more clean air in your building to decrease the risk of infection and create a safer, healthier environment. We work with you to develop the specific strategy that's right for your facility, building on five pillars aligned with ASHRAE and CDC guidelines.

Ventilation

What it does: Dilutes dirty air with clean air as available from the outside

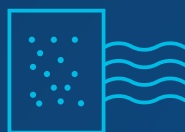

How we do it: Ensure delivery of ASHRAE required ventilation rates through service and solutions such as Metasys clean air monitoring

Filtration

What it does: Mechanically removes particles from the air

How we do it: Increase particle collection with options such as Koch Filters, MAC-10 Fan Filter Units, Enviro IsoClean Portable HEPA Filtration Units

Disinfection

What it does: Deactivates bacteria and viruses

How we do it: Add disinfection technologies such as ultraviolet C (UV-C) lighting and emerging technologies such as bi-polar ionization

Isolation

What it does: Contains particles to prevent them from going elsewhere in the building

How we do it: Create negative-pressure isolation environments with options such as IsoClean portable filtration units, Triatek room pressure controls and Metasys

Monitoring and Maintenance

What it is: Inspect and service equipment at the recommended frequency

How we do it: Track results, holding ourselves accountable to ensure you meet your goals. Provide ongoing maintenance and monitoring to maintain clean air.

Take the next step toward your desired outcomes. We help you enhance your building affordably and effectively through our unmatched expertise, broad portfolio, and consultative approach.

Call us to increase clean air delivery rates—and your peace of mind.
