IMPORTANT:
READ AND UNDERSTAND THIS MANUAL BEFORE USING THIS HEAT PUMP AIR CONDITIONER. KEEP THIS MANUAL FOR FUTURE REFERENCE.
ATTENTION

Each model number and all matching model numbers within a system must have the same version of software.

Follow these steps to verify that your product model numbers have the same version of software.
  • Access the main printed circuit board in each product.
  • Locate a white sticker with a P-XXXX number or
  • Connect a service checker and locate the ROM number.

For further assistance, please contact our Technical Support Center at 1 (844) 873-4445 and select Option 2.
**Important Notice**

- Johnson Controls Inc. pursues a policy of continuing improvement in design and performance in its products. As such, Johnson Controls Inc. reserves the right to make changes at any time without prior notice.
- Johnson Controls Inc. cannot anticipate every possible circumstance that might involve a potential hazard.
- This heat pump air conditioning unit is designed for standard air conditioning applications only. Do not use this unit for anything other than the purposes for which it was intended for.
- The installer and system specialist shall safeguard against leakage in accordance with local pipelifter and electrical codes. The following standards may be applicable, if local regulations are not available. International Organization for Standardization: (ISO 5149 or European Standard, EN 378). No part of this manual may be reproduced in any way without the expressed written consent of Johnson Controls Inc.
- This heat pump air conditioning unit will be operated and serviced in the United States of America and comes with a full complement of the appropriate Safety, Danger, and Caution, Warnings.
- If you have questions, please contact your distributor or dealer.
- This manual provides common descriptions, basic and advanced information to maintain and service this heat pump air conditioning unit which you operate as well for other models.
- This heat pump air conditioning unit has been designed for a specific temperature range. For optimum performance and long life, operate this unit within the range limits according to the table below.

DB: Dry Bulb, WB: Wet Bulb

* The temperature may change depending on the outdoor unit.

- This manual should be considered as a permanent part of the air conditioning equipment and should remain with the air conditioning equipment.

**Product Inspection upon Arrival**

1. Upon receiving this product, inspect it for any damages incurred in transit. Claims for damage, either apparent or concealed, should be filed immediately with the shipping company.
2. Check the model number, electrical characteristics (power supply, voltage, and frequency rating), and any accessories to determine if they agree with the purchase order.
3. The standard utilization for this unit is explained in these instructions. Use of this equipment for purposes other than what it designed for is not recommended.
4. Please contact your local agent or contractor as any issues involving installation, performance, or maintenance arise. Liability does not cover defects originating from unauthorized modifications performed by a customer without the written consent of Johnson Controls, Inc. Performing any mechanical alterations on this product without the consent of the manufacturer will render your warranty null and void.

1. Introduction

Read following sections carefully before installing this product.

Read over the "Installation and Maintenance Manual" for the outdoor unit as well.

Forward this information, and the warranty to all installers and users. Ask end users to maintain copies for future reference.

(Refrigerant Piping Work) ➔ (Electrical Wiring Work) ➔ (Ref. Charge Work) ➔ (Test Run) ➔ (User)

- For details on wiring between the indoor unit and the outdoor unit, refer to the "Installation and Maintenance Manual" for the outdoor unit.
- For details on the optional controller, refer to the "Installation and Maintenance Manual" for that optional controller module.
- For details on each optional part, refer to the "Installation and Maintenance Manual" for each optional part.
- For central station, refer to the "Installation and Maintenance Manual" for the central station.

2. Safety Instructions

Signal Words

| ![WARNING] | Indicates a hazardous situation that, if not avoided, could result in death or serious injury. |
| ![CAUTION] | Indicates a hazardous situation that, if not avoided, could result in minor or moderate injury. |
| ![NOTICE] | Indicates information considered important, but not hazard-related (for example, messages relating to property damage). |

General Precautions

To reduce the risk of serious injury or death, read these instructions thoroughly and follow all warnings or cautions included in all manuals that accompanied the product and are attached to the unit. Refer back to these safety instructions as needed.

- This system should be installed by personnel certified by Johnson Controls, Inc. Personnel must be qualified according to local, state and national building and safety codes and regulations. Incorrect installation could cause leaks, electric shock, fire or explosion. In areas where Seismic “Performance requirements are specified, the appropriate measures should be taken during installation to guard against possible damage or injury that might occur in an earthquake if the unit is not installed correctly, injuries may occur due to a falling unit.

- Use appropriate Personal Protective Equipment (PPE), such as gloves and protective goggles and, where appropriate, have a gas mask nearby. Also use electrical protection equipment and tools suited for electrical operation purposes. Keep a quenching cloth and a fire extinguisher nearby during brazing. Use care in handling, rigging, and setting of bulky equipment.

- When transporting, be careful when picking up, moving and mounting these units. Although the unit may be packed using plastic straps, do not use them for transporting the unit from one location to another. Do not stand on or put any material on the unit. Get a partner to help, and bend with your knees when lifting to reduce strain on your back. Sharp edges or thin aluminum fins on the air conditioner can cut fingers, so wear protective gloves.
Do not touch or adjust any safety devices inside the indoor or outdoor units. All safety features, disengagement, and interlocks must be in place and functioning correctly before the equipment is put into operation. If these devices are improperly adjusted or tampered with in any way, a serious accident can occur. Never bypass or jump-out any safety device or switch.

Before servicing, turn-OFF the power supply and use accepted lockout and tag out procedures at all main switches.

This unit is the pressurized system. Never loosen threaded joints while the system is under pressure and never open pressurized system parts.

Johnson Controls will not assume any liability for injuries or damage caused by not following steps outlined or described in this manual. Unauthorized modifications to Johnson Controls products are prohibited as they...

- May create hazards which could result in death, serious injury or equipment damage;
- Will void product warranties;
- May invalidate product regulatory certifications;
- May violate OSHA standards;

Take the following precautions to reduce the risk of property damage.

- Be careful that moisture, dust, or variant refrigerant compounds not enter the refrigerant cycle during installation work. Foreign matter could damage internal components or cause blockages.
- If air filters are required on this unit, do not operate the unit without the air filter set in place. If the air filter is not installed, dust may accumulate and breakdown may result.
- Do not install this unit in any place where silicon gases can coalesce. If the silicon gas molecules attach themselves to the surface of the heat exchanger, the finned surfaces will repel water. As a result, any amount of drainage moisture condensate can overflow from the drain pan and could run inside of the electrical box, possibly causing electrical failures.
- When installing the unit in a hospital or other facility where electromagnetic waves are generated from nearby medical and/or electronic devices, be prepared for noise and electronic interference. Electromagnetic Interference (EMI). Do not install where the waves can directly radiate into the electrical box, controller cable, or controller. Inverters, appliances, high-frequency medical equipment, and radio communications equipment may cause the unit to malfunction. The operation of the unit may also adversely affect these same devices. Install the unit at least 10 ft. (3m) away from such devices.
- When a wireless controller is used, locate at a distance of at least 3.3 ft. (1m) between the indoor unit and electric lighting. If not, the receiver part of the unit may have difficulty receiving operation commands.
- Do not install the unit in any location where animals and plants can come into direct contact with the outlet air stream. Exposure could adversely affect the animals and plants.
- Do not install the unit with any downward slope to the side of the drain adaptor. If you do, you may have drain water flowing back which may cause leaks.
- Be sure the drain hose discharges water properly. If connected incorrectly, it may cause leaks.
- Do not install the unit in any place where oil can seep onto the units, such as table or seating areas in restaurants, and so forth. For these locations or social venues, use specialized units with oil-resistant features built into them. In addition, use a specialized ceiling fan designed for restaurant use. These specialized oil-resistant units can be ordered for such applications. However, in places where large quantities of oil can splash onto the unit, such as a factory, even the specialized units cannot be used. These products should not be installed in such locations.

Installation Precautions

To reduce the risk of serious injury or death, the following installation precautions must be followed.

- When installing the unit into...
  - A wall: Make sure the wall is strong enough to hold the unit’s weight. It may be necessary to construct a strong wood or metal frame to provide added support.
  - A room: Properly insulate any refrigerant tubing run inside a room to prevent “sweating” that can cause dripping and water damage to wall and floors.
- Damp or uneven areas: Use a raised concrete pad or concrete blocks to provide a solid, level foundation for the unit to prevent water damage and abnormal vibration.
- An area with high winds: Securely anchor the outdoor unit down with bolts and a metal frame. Provide a suitable air baffle.
- A snowy area: Install the outdoor unit on a raised platform that is higher than drifting snow. Provide snow vents.

**Do not install the unit in the following places.** Doing so can result in an explosion, fire, deformation, corrosion, or product failure.
- Explosive or flammable atmosphere
- Where a fire, oil, steam or powder can directly enter the unit, such as nearby or above a kitchen stove.
- Where oil (including machinery oil) may be present.
- Where corrosive gases such as chlorine, bromine, or sulfide can accumulate, such as near a hot tub or a hot spring.
- Where dense, salt-laden airflow is heavy, such as in coastal regions.
- Where the air quality is of high acidity.
- Where harmful gases can be generated from decomposition.

**Do not position the drain pipe for the indoor unit near any sanitary sewers where corrosive gases may be present.** If you do, toxic gases can seep into breathable air spaces and can cause respiratory injuries. If the drain pipe is installed incorrectly, water leakage and damage to the ceiling, floor, furniture, or other possessions may result. If the drain pipe becomes clogged, water may drip from the indoor unit. Do not install the indoor unit where such dripping can cause moisture damage or uneven locations: Use a raised concrete pad or concrete blocks to provide a solid, level foundation for the unit to prevent water damage and abnormal vibration.

- **Before performing any brazing work,** be sure that there are no flammable materials or open flames nearby.
- **Perform a test run to ensure normal operation.** Safety guards, shields, barriers, covers, and protective devices must be in place while the compressor/unit is operating. During the test run, keep fingers and clothing away from any moving parts.
- **Clean up the site when finished,** remembering to check that no metal scraps or bits of wiring have been left inside the unit being installed.

After installation work for the system has been completed, explain the “Safety Precautions,” the proper use and maintenance of this unit to the customer according to the information in all manuals that came with the system. All manuals and warranty information must be given to the user or left near the Indoor Unit.
Refrigerant Precautions

To reduce the risk of serious injury or death, the following refrigerant precautions must be followed.

- As originally manufactured, this unit contains refrigerant installed by Johnson Controls. Johnson Controls uses only refrigerants that have been approved for use in the unit’s intended home country or market. Johnson Controls distributors similarly are only authorized to provide refrigerants that have been approved for use in the countries or markets they serve. The refrigerant used in this unit is identified on the unit’s faceplate and/or in the associated manuals. Any additions of refrigerant into this unit must comply with the country’s requirements with regard to refrigerant use and should be obtained from Johnson Controls distributors. Use of any non-approved refrigerant substitutes will void the warranty and will increase the potential risk of injury or death.
- If installed in a small room, take measures to prevent the refrigerant from exceeding the maximum allowable concentration in the event that refrigerant gases should escape. Refrigerant gases can cause asphyxiation (0.026 lbs/ft³ (0.42 kg/m³) based on ISO 5149 for R410A). Consult with your distributor for countermeasures (ventilation system and so on). If refrigerant gas has leaked during the installation work, ventilate the room immediately.
- Before installation is complete, make sure that the refrigerant leak test has been performed. If refrigerant gases escape into the air, turn OFF the main switch, extinguish any open flames and contact your service contractor. Refrigerant (Fluorocarbon) for this unit is odorless. If the refrigerant should leak and come into contact with open flames, toxic gas could be generated. Also, because the fluorocarbons are heavier than air, they settle to the floor, which could cause asphyxiation.
- When installing the unit, and connecting refrigerant piping, keep all piping runs as short as possible, and make sure to securely connect the refrigerant piping before the compressor starts operating. If the refrigerant piping is not connected and the compressor activates with the stop valve opened, the refrigerant cycle will become subjected to extremely high pressure, which can cause an explosion or fire.
- Tighten the flare nut with a torque wrench in the specified manner. Do not apply excessive force to the flare nut when tightening. If you do, the flare nut can crack and refrigerant leakage may occur.
- A compressor/unit comprises a pressurized system. Never loosen threaded joints while the system is under pressure and never open pressurized system parts.
- When maintaining, relocating, and disposing of the unit, dismantle the refrigerant piping after the compressor stops.

Electrical Precautions

Take the following precautions to reduce the risk of electric shock, fire or explosion resulting in serious injury or death.

- Highly dangerous electrical voltages are used in this system. Carefully refer to the wiring diagram and these instructions when wiring. Improper connections and inadequate grounding can cause serious injury or death.
- Before servicing, open and tag all disconnect switches. Never assume electrical power is disconnected. Check with meter and equipment.
- Only use electrical protection equipment and tools suited for this installation.
- Use specified cables between units.
- Communication cable shall be a minimum of AWG18 (0.82mm²), 2-Conductor, Stranded Copper. Shielded cable must be considered for applications and routing in areas of high EMI and other sources of potentially excessive electrical noise to reduce the potential for communication errors. When shielded cable is applied, proper bonding and termination of the cable shield is required as per Johnson Controls guidelines. Plenum and riser ratings for communication cables must be considered per application and local code requirements.
- Use an exclusive power supply for the air conditioner at the unit’s rated voltage.
- Be sure to install circuit breakers (ground fault interrupter, isolating switch, molded case circuit breaker and so on), with the specified capacity. Ensure that the wiring terminals are tightened securely to recommended torque specifications. If a circuit breaker or fuse is frequently activated, shut down the system and contact your service contractor.
- Clamp electrical wires securely with a cable clamp after all wiring is connected to the terminal block. In addition, run wires securely through the wiring access channel.
- When installing the power lines, do not apply tension to the cables. Secure the suspended cables at regular intervals, but not too tightly.
- Make sure that the terminals do not come into contact with the surface of the electrical box. If the terminals are too close to the surface, it may lead to failures at the terminal connection.
- Turn OFF and disconnect the unit from the power supply when handling the service connector. Do not open the service cover or access panel to the indoor or outdoor units without turning OFF the main power supply.
- After stopping operation, be sure to wait at least five minutes before turning off the main power switch. Otherwise, water leakage or electrical breakdown may result. Disconnect the power supply completely before attempting any maintenance for electrical parts. Check to ensure that no residual voltage is present after disconnecting the power supply.
- Do not clean with, or pour water into, the controller as it could cause electric shock and/or damage the unit. Do not use strong detergent such as a solvent. Clean with a soft cloth.
- Check that the ground wiring is securely connected. Do not connect ground wiring to gas piping, water piping, lighting conductor, or telephone ground wiring.
- If a circuit breaker or fuse is frequently activated, shut down the system and contact your service contractor.
CAUTION

- Proper handling of this unit requires two-people. Safe handling and installing the indoor unit requires the strength of two people. Mounting the unit alone may cause injury due to fall of the unit. Although the unit may be girded with steel banding, do not use it for transportation. Avoid contact with finned surfaces of the heat exchanger as sharp edges can cause severe injury to hands and fingers. Use appropriate work gloves for the job.

NOTICE

- Check to ensure that the drain hose discharges moisture properly. If connected incorrectly, it can result in leakage and damage to furniture.
- Make sure to use the factory-supplied drain hose and hose clamp. Other makes can cause moisture leakage.
- Do not bend or twist the factory-supplied drain hose. This could compromise the seal and result in moisture leakage.
- Do not apply an excessive force to the drain pipe connection. This can also compromise the seal properties of the connection.
- Verify that the installed unit is level with floor and ceiling surfaces. Any variance or inclination can cause moisture to back up into the drain pan, overflow, and seepage onto ceiling or wall surfaces, and cause damage to carpeted surfaces or furniture below.
- Do not install this system in close proximity to septic sewer lines where flammable and toxic gases can coalesce.
- Inspect the drain pan before the onset of winter to drain away all accumulated moisture in the pan.
- The heat exchanger of indoor unit overheats whenever there is a slight amount of refrigerant circulating during slowdown or stoppage. As a result, moisture in the drain pan evaporates where it can condense on ceiling or wall surfaces.
- After the drain check is completed, insert the rubber plug again and seal the gap with a silicon sealant.

Electrical Installation

WARNING

In some cases, the packaged air conditioner may not be operated normally under the following cases:

- When electrical power for the packaged air conditioner is supplied from the same power transformer as the device*.
- When the power supply wiring for the device* and the packaged air conditioner are located close to each other:
  
  Device*: (Example): Lift, container crane, rectifier for electric railway, inverter power device, arc furnace, electric furnace, large-sized induction motor, and large-sized switch.

It consumes large quantities of electrical power.

Regarding that mentioned above, surge voltage may be inducted into the power supply wiring for the crated air conditioner due to a spike in power consumption for this device and an activation of the switch. Check the field regulations and standards before performing any electrical work in order to safeguard the power supply for the crated air conditioner unit.
3. Before Installation

3.1 Combination of Outdoor Unit and Indoor Unit
The combination capacity of indoor unit against the outdoor unit is selected depending on the outdoor unit capacity. Refer to “Installation and Maintenance Manual” for outdoor unit to decide the required combination of indoor and outdoor units, and the combination unit capacity.

3.2 Transportation and Handling
(1) Transport the product as close to the installation location as possible before unpacking.
(2) Do not lay any objects on the indoor unit.
(3) The indoor unit comes crated upside-down with the foam polystyrene drain pan positioned on top. Do not invert the unit until it is ready to be suspended above the floor. Inverting the unit while on the floor will crush the drain pan. Do not handle the unit by grabbing at the polystyrene pan and other air outlets as they are fragile and will sustain damage.
(4) The indoor unit handle is fabricated from foam polystyrene and is susceptible to breakage if any excessive force is applied as a result of mishandling of the unit during installation.
3.3 Factory-Supplied Accessories
Check to ensure that the following accessories are packed with the indoor unit. The screws, washers and flare nuts are packed in the pipe insulation.

<table>

</tbody>
</table>

**NOTE:**
Use tools and measuring instruments (vacuum pump, gas hose, charging cylinder, manifold gauge) exclusively for refrigerant R410A.

3.5 Removing Cushioning
Make sure to remove the cushioning from inside of the unit. If operating without removing the cushioning, abnormal sound and abnormal heat generation may occur.
4. **Installation Location**

1. Install the indoor unit, allowing for proper clearance for operation and maintenance access, as shown in Figure 4.1.

![Figure 4.1 Operation and Installation Space](image)

(2) Consider the air distribution from the indoor unit to the space of the room, and select a suitable location so that uniform air temperature in the room can be obtained.

(3) Do not leave combustible materials inside the service space of the indoor unit.

(4) Avoid obstacles which may hamper the air intake or the air discharge flow.

(5) Do not install the indoor unit in a machine shop or kitchen where vapor from oil or its mist flows to the indoor unit. The oil will deposit on the heat exchanger, thereby reducing the indoor unit performance, and may deform and in the worst case, break the plastic parts of the indoor unit.

(6) Pay attention to the following points when the indoor unit is installed in a hospital or other facilities where there are electronic waves from medical equipment.

   a. Do not install the indoor unit where the electromagnetic wave is directly radiated to the electrical box, communication cable or wired controller.

   b. Install the indoor unit and components as far away as practical or at least 9.8ft (3m) from any electromagnetic wave radiator.

   c. Prepare a steel box and install the wired controller in it. Prepare a steel conduit tube and wire the controller cable in it. Then, connect the ground wiring with the box and the tube.

   d. Install a noise filter when the power supply emits harmful noises.

(7) To avoid any corrosive action to the heat exchangers, do not install the indoor unit in an acid or alkaline environment.
5. **Installation Work**

5.1 **Suspension Bolts**

(1) Determine the final location and installation orientation of the indoor unit with respect to the space allowed for piping, wiring, and maintenance access.

(2) Mount suspension bolts, as shown in Figure 5.1.

5.2 **Marking of Positions of Suspension Bolts and Piping Connections**

(1) Mark the positions of the suspension bolts, refrigerant piping connections and drain connection.

(2) Installation dimensions are shown in Figure 5.2.

5.3 **Mounting Indoor Unit**

Hang the indoor unit as shown in Figure 5.3.

**Field-Supplied Parts**

* Suspension Bolts: 4-M10 or W3/8
* Nut: 8-M10 or W3/8

---

**Figure 5.1 Mounting of Suspension Bolts**

**Figure 5.2 Suspension Bolts**

**Figure 5.3 Mounting Indoor Unit**
(1) How to install Nuts or Suspension Bolts
Install nuts on each of the four suspension bolts, as shown in Figure 5.4.

(2) Suspension Indoor Unit
* Hook the suspension bracket to the nut and washer of each suspension bolt, as shown, starting at the opposite side and working over to the service cover side.
* After verifying that the nut and washer are correctly affixed to the retainers on the suspension bracket, hook the suspension bracket of the service cover side to the nut and washer. (Install the suspension bolts away from the unit when fastening.)

5.4 Adjusting of Unit Level
(1) Use a level to verify that the unit is perfectly horizontal. There should be no degree of slope present.

(2) The unit should be installed so that the rear side of the unit is slightly (0 to 3/16 inch (0 to 5mm)) lower than the front side, to allow for proper drainage.
(3) Tighten the bolts of the nuts with the suspension brackets after adjustment is completed. Adhesive must be applied to the bolts in order to prevent them from loosening.

NOTE: During position the installation process, keep the unit well covered with vinyl cover and related components covered until it is time to hoist into position.
5.5 Connecting Supply Duct

(1) The supply duct should be connected with the indoor unit through canvas ducts, in order to avoid abnormal sound vibration (Refer to Figure 5.7). The unit is equipped with a pre-drilled duct flange for the return and supply duct connection.

(2) Attach the vibration proof rubber to the Suspension Bolt in order to avoid abnormal sound vibration.

(3) Duct material should be non-flammable material.

(4) Perform heat insulation work over the duct to prevent condensation.

**CAUTION**

- If a lower sound level is required, install silencer (field-supplied).
- Design duct arrangement as "Unit External Static Pressure = Pressure Drop of Duct + Pressure Drop of Air Outlet and Air Inlet". Poorly designed duct will result in sound, comfort and water blow-off issues.

### < Notice for Outdoor Air Intake (Fresh Air) >

This air conditioner unit is NOT designed for outdoor use. The following items are to be strictly observed when designing a system for fresh air intake from the outdoors.

1) Considering Ventilation Load

   Calculate the air-conditioning load properly with the load of the outdoor air intake. If the load of the outdoor air is not considered, it may cause insufficient cooling or heating operation due to an excessive air-conditioning load against the unit capacity.

2) Limits on Outdoor Air Intake

   - Do NOT ingest air from the outdoors directly into the indoor unit.

   If an outdoor fresh air intake is necessary for air-conditioning, Johnson Controls Inc. recommends the installation of the ERV (Energy Recovery Ventilation) (Field-supplied) system. The outdoor air shall be processed by the ERV and mixed with indoor air. Only then, is air that now intermixed can be drawn into the indoor unit.

   **NOTE:**

   The temperature of the air that is intermixed should fall within the working range as shown below.

   ![Temperature Range Table](image)

   - If the ERV is not used for processing the outdoor air, it can result in insufficient heating/cooling operation or condensation build-up on the inside surfaces of the indoor unit or duct depending on the outdoor air conditions.

   - The volume of fresh air is recommended to be within 20% of the airflow volume “Hi2” according to the specification’s table in the technical documentation. If it exceeds 20%, ingested condensation will build-up on the inside surfaces of the indoor unit and the airflow volume of the indoor unit cannot be adjusted due to increasing pressure loss of air intake caused by insufficient internal static pressure.

   - When the outdoor air is ingested into the indoor unit, make sure to install an air filter capable of keeping the indoor unit free from dust.

3) Facilities for Outdoor Air Intake

   - Use the damper or the duct fan to adjust fresh air volume.

   - Do NOT ingest in fresh air from the outdoors directly into the indoor unit.

   Installing and integrating ERV as a part of the system mix is recommended if incoming air from outdoors is routinely drawn indoors.

   - When using ERV or installing a duct fan, make sure to install the interlock circuit between them and the indoor unit fan motor. Make sure to install an ERV in accordance with this manual.

   - Install thermal insulation on surfaces of interconnecting ducts to prevent the build-up of condensation.
5.6 Setting of External Pressure

Refer to Section 8.6 "External Static Pressure Setting".

---

**CAUTION**

- If a lower sound level is further required, install silencer (field-supplied).
- The facility design should be “Unit External Static Pressure = Duct Pressure Loss + Suction / Discharge Pressure Loss”.

If the duct pressure loss drops below the external static pressure, air speed will increase and lead to the occurrence of louder noise, splashing water and activation of motor protection circuit activated. If the unit external static pressure drops below the duct pressure loss, some problems such as inability to change the air speed may occur. Set the airflow control damper or shift the static pressure control switch to adjust to almost equalize the level between the external static pressure and the duct pressure loss. (See “Setting of External Pressure” section for details.)
- Basically this unit is designed to install the ducts on the inlet side and the outlet side. Ask for more information for using the return ducts in the ceiling.

---

*: Before Shipment
6. Refrigerant Piping Work

DANGER

Use the specified non-flammable refrigerant (R410A) to the outdoor unit in the refrigerant cycle. Do not charge the unit with materials other than R410A, such as hydrocarbon refrigerants (propane and isobutane), oxygen, flammable gases (acetylene, ammonia, etc.) or poisonous gases when installing, maintaining and moving the unit. These flammables are extremely dangerous and may cause explosion, a fire, or injury.

For details on refrigerant piping work, vacuum pump, and refrigerant charge, refer to the "Installation and Maintenance Manual" for the outdoor unit.

6.1 Piping Materials

(1) The tolerance of refrigerant piping length differs depending on the combination with the outdoor unit. Refer to "Installation and Maintenance Manual" of the outdoor unit for details.

(2) Select the piping size from the following table.

<table>
<thead>
<tr>
<th>Model</th>
<th>Gas Piping</th>
<th>Liquid Piping</th>
</tr>
</thead>
<tbody>
<tr>
<td>(H,Y,C)IDS006B21S</td>
<td>φ1/2 (12.7)</td>
<td>φ1/4 (6.35)</td>
</tr>
<tr>
<td>(H,Y,C)IDS008B21S</td>
<td></td>
<td></td>
</tr>

<td></td>
<td></td>
</tr>
<tr>
<td>(H,Y,C)IDS018B21S</td>
<td>φ5/8 (15.88)</td>
<td>φ3/8 (9.52)</td>
</tr>
</tbody>
</table>

(3) Prepare field-supplied copper pipes.

(4) Select clean copper pipes. Make sure there is no dust and moisture inside.

(5) The refrigerant oil for the refrigerant R410A is susceptible to moisture, an oxide film, and fatty oil. Take special care during the installation so that moisture, contaminations or old refrigerant oil will not enter the refrigerant cycle. Otherwise, impurities may adhere to the expansion valve and it may prevent proper operation.

(6) When cutting the pipes, use a pipe cutter to avoid grind swarf generation for the pipe cutting work. Blow the inside of pipes with nitrogen or dry air to remove any dust or foreign materials before connecting pipes. Do not use any tools which produce a lot of swarf such as a saw or a grinder.

In Case of Getting the Pipe Through a Hole in the Wall

Correct
attach a cap or put a plastic bag over the pipe end.

Incorrect
hole

In Case of Rain

Correct
Rain water can come in.

Incorrect
Rubber Band

Do not lay the pipe directly on the ground.

Correct
Attach a cap or put a plastic bag over the pipe end.

Incorrect

6.2  Piping Connection

(1) Position of piping connection is shown below.

(2) Perform the flaring work as shown below.

(3) Use specific flare nut attached with the unit.

(4) Verify that there are no scratches, burrs stuck to internal surfaces, or surface deformations at the flared opening.

(5) Before tightening the flare nut, apply the (Field-Supplied) refrigerant oil in a thin layer over the flared part. (Do not apply the oil on other areas.) Tighten the flare nut for the liquid pipe to the specified torque with two spanners. Then, tighten the flare nut for the gas piping in the same way. After the tightening work has been completed, check that no refrigerant leakage occurs.

NOTE:
Refrigerant oil is field-supplied.
[ Polyvinyl Ether Oil FVC68D (Idemitsu Lubricants America) ]

Apply Refrigerant Oil.

---

**Required Tightening Torque (JIS B 8607)**

<table>
<thead>
<tr>
<th>Pipe Size</th>
<th>Tightening Torque</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/4 inch (6.35 mm)</td>
<td>10.3 - 13.3 ft·lbs (14 - 18 N·m)</td>
</tr>
<tr>
<td>3/8 inch (9.52 mm)</td>
<td>25.1 - 31.0 ft·lbs (34 - 42 N·m)</td>
</tr>
<tr>
<td>1/2 inch (12.7 mm)</td>
<td>36.1 - 45.0 ft·lbs (49 - 61 N·m)</td>
</tr>
<tr>
<td>5/8 inch (15.88 mm)</td>
<td>50.2 - 60.5 ft·lbs (68 - 82 N·m)</td>
</tr>
</tbody>
</table>
(6) Wherever buried piping exists on site, make sure there is a service doorway to provide adequate access to inspect piping sockets and elbows, and for interconnecting parts.

(7) Piping must be reinforced to withstand earthquakes so as not to be damaged by an external force.

(8) Do not tightly secure refrigerant piping to accommodate expansion and contraction.

(9) Prevent the pipes from contacting weak portions such as wall, ceiling, etc. (Otherwise, abnormal sound may be heard due to vibration of the piping.)

(10) Test for air-tight integrity. The air-tight procedures should be performed in accordance with the "Installation and Maintenance Manual" for the outdoor unit.

(11) If temperature and humidity inside the ceiling exceed 80.6°F (27°C)/RH80%, condensation occurs on the surface of the accessory insulation. Wrap additional insulation (approximately 3/16~3/8 inch (5~10mm) thickness) around the accessory insulation of the refrigerant pipe as a preventive measure.

(12) Insulate each flare connection without gap with accessory insulations to prevent condensation. Then insulate each refrigerant pipe as well.

**WARNING**

- Do not apply excessive force to the flare nut when tightening. Use the specified tightening torque.
- Make sure that the refrigerant leak test has been performed. Refrigerant (fluorocarbon) for this unit is non-flammable, non-toxic and odorless. However if the refrigerant should leak and contact with fire, toxic gas will be generated. Also because the fluorocarbon is heavier than air, it settles near the floor, which could cause suffocation.
7. Drain Piping

**WARNING**

Do not put the drain pipe for the indoor unit into the drainage trench where corrosive gases occur. Otherwise, poisonous gases flow into the room, which may cause poisoning.

**NOTICE**

- Ensure that the drain pipe discharges water properly. If connected incorrectly, it may cause leaks leading to property damage.
- Do not provide an upward slope or a rising part for the drain pipe. Otherwise, the drain water will flow back into the unit and it may cause the water leakage when the unit operation is stopped.
- Do not connect the drain pipe with a sanitary or sewage pipe or any other drainage pipe.
- When the common drain pipe is connected with other indoor units, the connected position of each indoor unit must be higher than the common pipe. The pipe size of the common drain pipe must be large enough according to the unit size and number of units.
- After performing drain piping work and electrical wiring, ensure to ensure that water flows smoothly as in the following procedures.

Perform drain piping work and attach the insulations before refrigerant piping work.

1. The position of the drain pipe connection is shown in Figure 7.1.
2. Prepare a polyvinyl chloride (PVC) pipe with 1-1/4 inches (32mm) outer diameter.
3. Fasten the tube to the drain hose with the adhesive agent and the field-supplied clamp. The drain piping must be performed with a DOWN-SLOPE pitch of 1/25 to 1/100.
4. Insulate the drain pipe after connecting the drain hose.

**NOTE:**

When the relative humidity of inlet or ambient air exceeds 80%, apply an auxiliary drain pan (field-supplied) beneath the indoor unit as shown in Figure 7.2.

---

**Figure 7.1 Drain Piping**

**Figure 7.2 Auxiliary Drain Pan**
NOTICE

After performing drain piping work and electrical wiring, verify that water flows smoothly as in the following procedure.

Checking with the Float Switch
a. Turn ON the power supply.
b. Pour 68 to 84oz (2 to 2.5 liters) of water into the drain pan.
c. Ensure that the water flows smoothly and no water leakage occurs. When water cannot be found at the end of the drain piping, pour another 68oz (2 liters) of water into the drain pan.
8. Electrical Wiring

**WARNING**

- All electrical work must be done as outlined in this manual and in accordance with this manual. Substandard work can result in fire and damage to the unit.
- Use specified cables between units and choose the cables correctly. If not, an electrical shock or fire may occur.
- Do not open the service cover or access panel for the indoor or outdoor units without turning OFF the main power supply. It can result in an electrical shock.
- Turn OFF the main power switch of the indoor unit and the outdoor unit before attempting any electrical wiring work or a periodical check is performed. If not, it will result in an electric shock or a fire.
- Check to ensure that the indoor fan and the outdoor fan have stopped before attempting any electrical wiring work or for any scheduled electrical work that is being performed.
- Tighten screws according to the following torque.
  - M3.5: 0.9 ft·lbs (1.2 N·m)
  - M4: 0.7 to 1.0 ft·lbs (1.0 to 1.3 N·m)

**CAUTION**

- Secure all cables together with zip-ties and seal the connecting hole against the onslaught of moisture and insects.
- Run the electrical wiring through the connecting hole in the side cover when using conduit.
- Secure the wired controller cable using the cable clamp inside the electrical box.

8.1 General Check

1. Make sure that the field-selected electrical components: (main power switches, circuit breakers, wires, conduit connectors, and wire terminals) have been properly labeled in accordance with electrical data as specified in the Engineering Manual. Make sure that the components comply with the National Electrical Code (NEC).

2. Check to ensure that the power supply voltage is within ±10% of the rated voltage.

3. Check the capacity of the electrical wires.
   - If the power supply capacity is too low, the system cannot be started due to a voltage drop.

4. Verify that the ground wiring is securely connected.
8.2 Electrical Wiring Capacity

8.2.1 Field Minimum Wire Sizes for Power Supply

- This equipment can be installed with a Ground Fault Circuit Interrupter (GFCI), which is a recognized measure for added protection to a properly grounded unit. Install appropriate sized breakers / fuses / overcurrent protection switches and wiring in accordance to local, state and NEC codes and requirements. The equipment installer is responsible for understanding and abiding by applicable codes and requirements. Failure to use a GFCI can result in electrical shock or fire.
- Do not operate the system until all the check points have been cleared.
  (A) Verify that electrical resistance is more than one megaohm by measuring the resistance between ground and the terminals of the various electrical components. If less than one megaohm, do not activate the system until the electrical current drain is found and repaired.
  (B) Check to ensure that the stop valves for the outdoor unit are fully opened, and then start the system.
  (C) Check to see that the main power has been switched ON for longer than 12 hours prior activating the system. Power to the crankcase heater needs this time interval to warm the compressor oil up to operating temperature.
- Do not touch any of the parts by hand at the discharge gas side, since the compressor chamber and the pipes at the discharge side are heated higher than 194°F (90°C).

8.2.2 Details of Electrical Wiring Connection

The electrical wiring capacity of the outdoor unit should be referred according to the "Installation and Maintenance Manual" for the outdoor unit. Adjusting the DIP switches may be required depending on the arrangement with the outdoor unit.
Select wiring capacity according to the table 8.1. Install a GFCI (Ground Fault Circuit Interrupter) and main switch as shown in each of the system diagrams below.

< Heat Pump System >

< Heat Recovery System >
Table 8.1 Recommended Wiring Capacity and Size

<table>
<thead>
<tr>
<th>Model</th>
<th>Power Supply</th>

<td>(H,Y,C)IDS018B21S</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

NOTES:
1) Follow local codes and regulations when selecting field wires.
2) Select a GFCI with an activation speed of 0.1 sec. or less.
3) Total operating current is less than 12A.
8.3 Position of Electrical Wiring Connection

- The electrical wiring connection for the indoor unit is shown in the Section 8.2.2.
- The connection at the terminal block for the indoor unit is shown in the figure below. Check the outdoor unit for the combination before the wiring work. The screws at the terminal block should be performed according to the tightening torque as shown in the table below.

<table>
<thead>
<tr>
<th>Screw Size</th>
<th>Tightening Torque</th>
</tr>
</thead>
<tbody>
<tr>
<td>TB1 M4</td>
<td>0.7 - 1.0 ft·lbs (1.0 - 1.3 N·m)</td>
</tr>
</tbody>
</table>

Tightening Torque for Terminals

- Notice
  - Do not connect the main power supply wiring to the communication line (Terminals A, B, 1 and 2 of TB2). If these are connected, the printed circuit board (PCB) will be destroyed.
  - Note the following for wire connections at TB1 and TB2:
    (A) Attach a piece of insulation tape or sleeve at each terminal.
    (B) Maintain a safe distance between the electrical box and the terminals to prevent a short circuit.
    (C) Maintain a safe distance between the terminals.
(1) Connect the cable for the optional controller or the optional extension cable to the terminals inside the electrical box through the connecting hole of the cabinet.

(2) Connect the power supply and the ground wiring to the terminals in the electrical box.

(3) Connect the cables between the indoor unit and the outdoor unit to the terminals inside the electrical box.

(4) Connect cables to their corresponding terminal number and the similarly marked band.

(5) Connect the communication cable between those indoor units connected to the same outdoor unit.

(6) Do not connect the main power supply wiring to the communication line (Terminals A, B, 1 and 2 of TB2). If connected, the printed circuit board (PCB) will be destroyed.

(7) Tightly clamp the power supply wiring and communication cables using the cable clamp inside the electrical box.

**NOTE:**

When the standard wire is used for the field-wiring connection, the M4 crimping terminal should be used. When the single wire is used, fashion it into the shape as shown at right and connect it in order to tighten the washer uniformly. The screws at the terminal block should be tightened according to the torque specification as shown in the table above.

(8) All electrical work should be performed in strict accordance with electrical schematics in the "Installation and Maintenance Manual".

(9) If Power Supply Voltage (208V/230V) is introduced into the Communication Line:

If 208V/230V are applied to the communication line at (Terminals 1 and 2 of TB2) by mistake, the fuse on the PCB for the communication line will blow. In this case, perform the recovery work as shown in the diagrams below.

(a) Reconnect the wirings correctly.

(b) Set the No.1 pin at DSW7 (on the PCB) to ON.

Upon PCB recovery after the fuse has been replaced, if 208V / 230V is reintroduced into the communication line, the PCB will be seriously damaged and will not recover.
1. The DIP switch settings for the outdoor unit should be performed in accordance with the "Installation and Maintenance Manual" for the outdoor unit.

2. Be aware that communication cable for the wired controller is required in these instances:
   a. The following functions are set to the sub unit which is not installed with the wired controller.
      - Remote ON/OFF function settings, (No.1, 2, and 3), (External Input / Output Function)
      - Power supply ON/OFF functions, (No.1 and 2), (Function Selection)
      - Prohibiting the wired controller after manual stoppage (External Input / Output Function)
      - Group setting by the centralized controller
   b. The combination of twin, triple, or quad is controlled by single wired controller.
   c. The address for the indoor unit is changed from the wired controller.

---

**NOTICE**

1. VRF Systems
   
   (a) Wired Controllers to each Unit for Individual Operation Setting

   (b) Single Wired Controller for Individual Operation Setting

   (c) Wired Controller Connections between different Refrigerant Cycles

---
< Caution for Electrical Wiring >

- Do not connect the power supply wiring and the communication cable into one terminal.
- The manual switchbox is required when communication cable is required.
8.4 Wiring Connection

(1) Remove the connecting hole cover of the electrical box and install the rubber bush (Accessory) to the connecting hole for communication cable.

(2) Pass the communication cable and the wired controller cable through the connecting hole for communication cable.
   Connect the communication cable to the terminals 1, 2 of TB2 in the electrical box.
   Connect the wired controller cable to the terminals A, B of TB2 in the electrical box.

(3) Pass the power supply wiring and the ground wiring through the connecting hole for power supply wiring.
   Connect the power supply wiring to the terminals L1, L2 of TB1 in the electrical box.
   Connect the ground wiring to the ground terminal inside the electrical box.
   (When connecting the power supply wiring and the ground wiring outside of the unit, run through the conduit tube.)

(4) Tightly clamp the power supply wiring, the ground wiring, the wired controller cable and the communication cable utilizing the cord band.

**NOTE**
- Insert the communication cables and wired controller cable into the PVC tube “VW-1 600V” (Accessory) to separate them from the power supply wirings in the indoor unit.
- Fix the both ends of the PVC tube by cable clamp (Accessory).
- If shielded cable is used, terminate at the ground terminal.
8.5 DIP Switches Setting

(1) Turn OFF the power supply to both indoor and outdoor units before adjusting DIP switch settings. Otherwise, the setting will be invalidated and not take effect.

(2) Positions of DIP switches are shown below.

(3) Unit No. Setting (RSW1 & DSW6)
No setting is required. Indoor unit numbers are set by the auto-address function. If an indoor unit number setting is required, set the unit number of all indoor units respectively and sequentially by following setting position. It is recommended that you assign a number to each indoor unit from "1". A maximum of 64 indoor units per refrigerant cycle can be connected to an H-LINK II System. Though the available numbers range from zero to 63, the applicable number for the 64th indoor unit in theory supplants the number "zero". For the centralized control, this setting is required.

(4) Capacity Code Setting (DSW3)
No setting is required, due to setting before shipment. This switch is utilized for setting the capacity code which corresponds to the capacity of the indoor unit.

<table>
<thead>
<tr>
<th>Indoor Unit Capacity (kBtu/h)</th>
<th>06</th>
<th>08</th>
<th>12</th>
<th>15</th>
<th>18</th>
</tr>
</thead>
<tbody>
<tr>
<td>Setting Position</td>
<td>ON</td>

<td>ON</td>
<td>ON</td>
<td>ON</td>
</tr>
<tr>
<td>RSW1 (Units Digit)</td>
<td>OFF</td>
<td>OFF</td>
<td>OFF</td>
<td>OFF</td>
<td>OFF</td>
</tr>
</tbody>
</table>

Before shipment, DSW6 and RSW1 are set at "0". For the units supporting H-LINK II, the unit No. can be set for Max. 64 indoor units (No.0~63).

(5) Unit Model Code Setting (DSW4)
No setting is required. It is for setting the model code of the indoor unit.

(6) Refrigerant Cycle No. Setting (RSW2 & DSW5)
This setting is required. The unit arrives with all settings in the OFF position.

Before shipment, DSW5 and RSW2 are set at "0". For the units supporting H-LINK II, the ref. cycle No. can be set for Max. 64 cycles. (No. 0~63)
(7) Fuse Recover (DSW7)
* Factory Setting

* In the case of applying high voltage to the terminal 1 and 2 of TB2, the 0.5A fuse on the PCB is cut. In such a case, first reconnect the wirings correctly to TB2, and then set the No.1 pin to ON.

(8) Optional Function Setting (DSW8)
No setting is required, due to no function.

(9) Optional Function Setting (DSW9)
No setting is required, due to no function.

NOTES:
- The “■” mark indicates setting for DIP switches. Figures show setting before shipment.
- When the unit number and the refrigerant cycle are set, record the unit number and refrigerant cycle to facilitate service and maintenance thereafter.

NOTICE

Turn OFF all power supply of the indoor units and the outdoor units before DIP switch settings. Otherwise, the setting will be invalidated and not take effect.

8.6 External Static Pressure Setting
Static pressure setting on the wired controller ("C5"). Refer to “Installation & Maintenance Manual” of the wired controller for details.

<table>
<thead>
<tr>

8.7 Function Selection by Wired Controller
Each function can be selected with the wired controller. Refer to the “Installation and Maintenance Manual” for the wired controller and the “Engineering Manual” for details.

< Circulator Function at Heating Thermo-OFF >
This function maintains fan operation by the set airflow volume at the heating Thermo-OFF. It improves temperature distribution when the unit is mounted on a high ceiling.
9. Test Run

9.1 Before Test Run
Verify that there are no problems with the installation, and do not perform Test Run until all the following conditions have been resolved. Refer to the "Installation and Maintenance Manual" for the outdoor unit for details on Test Run operations from the outdoor unit.
Verify that refrigerant piping and the communication cable are connected to the same refrigerant cycle system. If not, it will cause an abnormal operation and damage to instrumentation.

(1) Verify that electrical resistance is more than one megaohm, by measuring the resistance between ground and the terminal the terminus for electrical components. If the electrical resistance is less than one megaohm, do NOT operate the system until the electrical current outflow to ground is detected and repaired. Do not introduce any high voltage to the terminals of the communication cables (TB2 [A, B, 1 and 2]).

(2) Verify that each wire is connected correctly at the correct phase for the power supply. If it is incorrectly connected, the unit will not operate and the wired controller will display the alarm code “05”. In this case, check the phase for the primary power supply according to the “Attention” label affixed to the back side of the service cover. Then, with the power supply turned OFF at the power supply, remake the necessary connections.

(3) Check to ensure that the main power supply has been turned ON for more than 12 hours, to warm up the compressor oil by the crankcase heater.

(4) Verify that all DIP Switch settings are correct. Refer to Section 8.5 “DIP Switches Setting”.

9.2 Test Run
After all installation work is completed, Test Run should be performed.

(1) Check to ensure that stop valves (gas and liquid) for the outdoor unit are fully opened.

(2) Whenever indoor units are connected to the VRF system, perform the Test Run for the indoor units one by one sequentially and then check the refrigerant piping system and the electrical wiring system for conformity. (If these multiple indoor units are operated simultaneously, system conformity cannot be verified.)

(3) Perform the Test Run in accordance with the following procedure. Ensure that the Test Run is carried out without any problem. The following procedure shows a case where a wired controller is utilized. If other controllers are activated instead, refer to the "Installation and Maintenance Manual" for those other controllers.

NOTE: The outdoor unit may not be operated depending on the indoor and outdoor temperature conditions. Refer to the "Installation and Maintenance Manual" for outdoor units for details.

(a) Press and hold “Menu” and “Back/Help” simultaneously for at least 3 seconds.
The Test Run menu will be displayed.

• The Test Run menu will be displayed.

Test Run Screen

NOTE
When the “00 unit” is displayed, the auto-address function may be working. Cancel “Test Run” mode and reset.
● The total number of connected indoor units is indicated on the LCD (Liquid Crystal Display). In the case of a twin combination (set of two indoor units), the total number of the connected indoor units is displayed as “2 units”, and where there is a triple combination (set of three indoor units), the total number of the connected indoor units is displayed as “3 units”.

● If the number indicated is not equal to the actual number of connected indoor units, the auto-address function is not performing correctly due to incorrect wiring or electrical interference. Turn OFF the power supply, and resolve the wiring issue after verifying the following items; (Do not repeat turning ON and OFF within a 10 second timespan.)
  ◦ The power supply to the indoor unit is not turned ON or there is an incorrect wiring issue.
  ◦ Incorrect connection of the interconnecting cable between indoor units or a poorly connected controller cable.
  ◦ Incorrect setting of the rotary switch and DIP switch for the indoor unit printed circuit board (PCB). (The setting is overlapped.)

● Press “◇ On/Off” to start the Test Run.

● Press “◇ On/Off” and set each item.

(b) Press “◇ On/Off”.
The RUN indicator turns ON and the operation starts. At this time, a two-hour OFF timer will be set automatically.

(c) Though temperature recordings by the thermistors are invalid during the Test Run phase, the protection devices are valid.

(d) For VRF System
According to the label; “Checking Method by 7-Segment Display” affixed to the inside of the front cover of the outdoor unit, check temperature, pressure, and operation frequency, and interconnected indoor unit numbers by 7-Segment displays.

(e) To complete Test Run, press “◇ On/Off” again or wait for the set Test Run time to pass.
When changing the Test Run time, press “△” or “▽” to select “TEST TIME”. Then, set the test run time (30 to 600 minutes) by pressing “<” or “>”.

● The RUN indicator on the wired controller for the indoor unit will flash orange (0.5 second ON/ 0.5 second OFF), indicative of a fault or error having been generated with activation of protection devices during the Test Run phase. Alarm code, unit model code, and the number of interconnected indoor units will be displayed on the LCD as shown below. If the RUN indicator on the wired controller flashes for two seconds ON and two seconds OFF, the source of the problem could be a failure in the communication cable between the indoor unit and the wired controller (a loose or severed connection). In this case, verify Section 9.3 “Alarm Code” and perform the appropriate troubleshooting measures. Consult with an authorized service engineer if the problem cannot be resolved at your end.

<td>Incorrect setting of indoor unit number for H-LINK type</td>
<td>Interconnected indoor units are not supporting H-LINK II ≥ 17</td>
</tr>
<tr>
<td>EE</td>
<td>Compressor</td>
<td>Compressor protection alarm</td>
<td>This alarm code displays when the alarms such as damage to the compressor occur three times within a six hour period.</td>
</tr>
</tbody>
</table>

- When the RUN indicator flashes every four seconds, there is a communication failure between the indoor unit and the wired controller (loose connector, disconnected or incorrect wiring, or a severed connection).
- The indication of the alarm code “EE” means serious abnormality to burn out the compressor.

Refer to the “Installation and Maintenance Manual” for the indoor/outdoor unit connections.

**NOTICE**

Do NOT operate the air conditioning just to run checks on electrical wiring until preparations for the Test Run phase is completed.

All the installation work of the air conditioning is completed. Handover this information to the building owner and request to maintain all the equipment manuals and warranty.

**Refrigerant Leak Check**
Conduct a periodic refrigerant leak check to maintain product performance and secure storage of refrigerant (Fluorocarbons). After completing installation, record the following results into this manual:
1. Results of a test for air-tight integrity
2. Total refrigerant charge volume dispensed (including a trim charge added following the installation)
3. Result of the refrigerant leak check

Then hand it over to users and ask them to retain for reference. All periodic service and maintenance procedures must be conducted only by authorized and trained personnel.
